

Q5:

Compare your procedural C version and OOP Task List version: List 3 problems you faced in the C version that were solved by using classes and methods in the OOP version.

1. **Data management:** In C, we had to manually manage structures and pass data between functions. In OOP, the Task List class keeps the task data together with the methods that operate on it.
2. **Code organization:** The C version required many separate functions, which made the code harder to organize and maintain. OOP methods such as `add Task()`, `remove Task()`, and `display Tasks()` keep related functionality inside the Task List class.
3. **Data protection:** In C, task data could be accessed and modified directly, increasing the chance of accidental changes. OOP uses **encapsulation**, so the class controls how its task data is accessed and modified through its methods.
